

SAFETY MANAGEMENT AND CONTROL SOLUTION FOR GATE LOCK

SUMMARY

The base stations of iron tower company are managed by unattended mode, with a huge number, and the total number is close to 3 million. Most of them are installed in remote and inaccessible places, so the safety management of base stations is particularly important. The key of base station security management is the lock management of base station.

The UT-A200E31 base station door lock security management and control system, which is closely combined with the platform software of tower group company, realizes remote app unlocking and local computer key unlocking, ensures that the base station door lock is under real-time monitoring, reduces the management problems caused by random unlocking, reduces the occurrence of equipment theft, and ensures the normal, safe and stable operation of the communication network.

ADVANTAGE

Unlocking record query

The system records the unlocking person, unlocking time, lock of base station, base station and other information in detail, which is convenient for relevant personnel to query the unlocking record.

High security level

The smart base station door lock has the anti-impact and anti-torque that meet the standard requirements; the key and the lock cylinder have two-way authentication, and the lock can be unlocked only after the authorization is confirmed. At the same time, the smart key has the function of identity authentication to prevent illegal users from using it.

Real time monitoring

When the intelligent base station door lock detects that the door lock is opened abnormally, it will send out an alarm message, and start the video monitoring system in the base station to further confirm the scene, so as to ensure the safety of base station equipment.

Authority allocation

It can be managed according to the identity of different personnel, such as the fixed authorization of the maintenance team and the iron tower company, the temporary authorization of the outsourcing personnel and the operator, the door lock of the base station within the effective range can be specified, and it can be opened many times within the effective time.
