

JOYO-B6 Compact Switching Error Prevention Integrated System

SUMMARY

This product is a compact version of the computer-based switching error prevention system. It uses a touch pad all-in-one computer as the display and operation terminal. Using the touch screen, one can perform equipment status checks, simulation previews, simulation training, and switching order management operations. The system integrates switching error prevention, statefeedback, operation order, and video linkage, which is simple, practical and reliable.

ADVANTAGE

Compact and practical

It uses a touch screen display for all input/output operations. No keyboard, mouse, or other peripheral equipment is needed. It also integrates the communication adapter and smart keyfob functions within the touchpad all-in-one computer. It is suitable for 35kV substations or switching stations.

High reliability

The product is designed and built for industrial applications with a high degree of reliability with a small form factor.

Fully support of interactive voice functions

The product supports interactive voice functions for the whole process of switching operations, from generating a switching order, sending/receiving the order to the end of the task and the order closeout. There are voice prompts in each above step, truly achieving the synchronization of voice and operations.

Easy to install

It can be wall-mounted, panel mounted and vertically mounted.
