

SIS Smart Interlocking System

SUMMARY

This product applies the English version of JOYO-B4 Computerized Switching Error Prevention Integrated System, with the computer as the display and operation terminal, and through the operation of the mouse, it can carry out the equipment status alignment, simulation preview, simulation training and switching order management. The system integrates the functions of microcomputer switching error prevention, state feedback, switching order manage and video linkage, which is simple, practical and reliable.

ADVANTAGE

English interface

The computer is used as the display terminal, and the software interface is displayed in English, which is simple and easy to use.

Strong expansibility

The system adopts modular design, flexible configuration, easy expansion, and can configure hardware resources according to needs, such as ground wire management, remote control locking, etc.

Switching order management

The system can integrate the function of switching order, generate the corresponding switching order information while simulating, and improve the switching operation efficiency.

Good compatibility

The software is suitable for Windows, UNIX and Linux platforms and provides a variety of options.
