

# DXGLQ Ground Wire Management System

## SUMMARY

This product is an intelligent device to manage the temporary ground wire. It can query the storage location of the temporary grounding wire, track and detect the location and status of the temporary ground wire in real time. After being associated with the switching error prevention system, it can realize the real-time error prevention check, truly implement the use of grounding wire according to regulations, have records to query, and provide a strong guarantee for power safety production.

## ADVANTAGE

### Real time acquisition of hanging and dismantling status

When hanging and removing the ground wire, the intelligent ground wire head automatically identifies the intelligent grounding pile, and sends the hanging and removing status and location information to the host through the wireless network in real time for real-time logic check to ensure that the hanging and removing is correct.

### Safe acquisition

The system adopts hard contact LOTO isolation technology to ensure the safe acquisition of real-time state of grounding wire.

### Forced interlocking and standardized management

Through forced interlocking and authorization, the standardized management of taking, using, returning and storing the grounding wire is realized.
