

UT-5286 Valve Status Monitoring Device

SUMMARY

This product realizes remote real-time monitoring and safety control of valve opening and closing status, which helps power plants, petroleum, chemical and other companies to master the operation status of equipment more comprehensively and improve the level of equipment management and safety production.

ADVANTAGE

Real-time monitoring

It can accurately detect the opening or closing state of various valves, and the response time of state displacement is less than 2 seconds.

Wireless

The battery power supply mode is adopted, and the service life is more than 8 years; The test data is communicated with the acquisition device through 433M wireless communication, and the open environment can reach 100 meters.

Safe operation

It can be automatically locked while the valve is under operation. The valve state detection sensor and locking structure can operate independently.
