

UT-5300 Communication Manager

SUMMARY

This product is the core hub of the automation system. It is used for information centralization and interaction between the control system and the terminal device, data upload and delivery, policy formulation and execution, and has functions of remote communication, intra-station communication, local monitoring, etc.

ADVANTAGE

Easy to maintain

The hardware is modular and easy to maintain and replace. Failure of any module does not affect the normal operation of other modules.

Supports multiple modes of operation

It support different operation modes, like single-machine single-network.

Stable performance

It supports dual-host, dual-power redundancy, high-speed backup switching mechanism based on inter-board circuit listening, to ensure the stability and reliability of the device.

Monitoring Communication Integration

It supports the integration of communication and monitoring. In an embedded device, local and remote communication and monitoring functions are implemented simultaneously, saving user investment and equipment installation space.
