

JOYO-E21 Distribution Network Intelligent Lock Management System

SUMMARY

Lock management has become a major problem in distribution network management due to the large number of ring cabinets and distribution rooms in distribution lines. This product only needs one smart key to open door locks of all distribution units, ring cabinets, etc. It also implements the management of unlocking rights of personnel, and the records of unlocking can be queried. It is a practical and efficient lock management system.

ADVANTAGE

Intelligent operation

Computer keys are authorized to open auxiliary locks; can limit the unlocking area and time range; has fixed authorization, temporary authorization and application authorization functions; has password authorization, authorization card authorization, remote authorization and other authorization methods.

Automatic storage of information

All personnel information, device lock information, authorization information, operation records are stored in the workstation, and authorization and operation information can be queried through related fields.

Smart key

A smart computer key replaces all existing mechanical keys.

Remote wireless information interaction

Operational information remote interaction to achieve real-time information interaction between management background and field operation, to meet the requirements of remote unlocking.
